34. Please identify any issues not mentioned above that the Copyright Office should consider in conducting this study.

Everyday citizens may be unable to/prevented from opting out of data mining for generative AI. It is highly likely data sets will include personal emails, voice calls, video chats, family photos, or any other minutiae of everyday people that can be accessed online. Additionally, a process to protect the images and information of the dead (i.e. family members, people on genealogy sites, dead actors' likeness or old family photos) should be considered.

There is a likelihood of adversaries (internal and abroad) using generative AI to spread misinformation and influence people, so screening for generative AI products and where they come from is not just a direct copyright concern.

There is potential loss of jobs and writing skill.

Compensation for copywrite holders should be considered (i.e. opting in to having material added to data set should not be for "free" or exchange to use a program).
